ABSTRACT:

There are many situations in topology where we build a topological space by starting with some simple spaces and doing some kind of “gluing” or “identifications”. The situations may look different at first, but really they are instances of the same general construction. The present chapter introduces $g^*\alpha$ -quotient map using and characterize their basic properties. Using these new types of function, several characterizations and its properties have been obtained.

KEYWORDS: $g^*\alpha$ -closed set, $g^*\alpha$ -continuous, $g^*\alpha$ -irresolute, $g^*\alpha$ -open set, $g^*\alpha$ -quotient map, strongly $g^*\alpha$ -quotient, strongly $g^*\alpha$ -quotient

I. INTRODUCTION

By considering the concept of g -closed[3] sets many concepts of topology have been generalized and interesting results have been obtained by several mathematicians. In this paper we introduce $g^*\alpha$ -quotient functions and we prove some of their basic properties.

II. PRELIMINARIES:

Throughout this paper $(X, \tau), (Y, \sigma)$ and (Z, η) (or $X, Y,$ and Z) represent nonempty topological spaces on which no separation axiom is defined unless otherwise mentioned. For a subset A of a space the closure of A , interior of A and complement of A are denoted by $cl(A), int(A)$ and A^c respectively.

We recall the following definitions which are useful in the sequel.

Definition 2.1.

1. A subset A of a space X is called g^* -closed [6] if $cl(A) \subseteq U$ whenever $A \subseteq U$ and U is g -open.
2. A subset A of a space X is called $g^*\alpha$ -closed [5] if $\alpha cl(A) \subseteq U$ whenever $A \subseteq U$ and U is g^* -open. The family of $g^*\alpha$ -closed sets are denoted by $G^*\alpha-C(X)$. The complement of above closed sets are called respectively their open sets.
3. $\alpha T_{1/2}^{**}$ -space [5] if every $g^*\alpha$ -closed set in it is closed.

Definition 2.2. A map $f: (X, \tau) \rightarrow (Y, \sigma)$ is said to be

- (i) $g^*\alpha$ -continuous [5] if $f^{-1}(V)$ is $g^*\alpha$ -closed in (X, τ) for every closed set V in (Y, σ) .
- (ii) $g^*\alpha$ -irresolute [5] if $f^{-1}(V)$ is $g^*\alpha$ -closed in (X, τ) for each $g^*\alpha$ -closed set V of (Y, σ) .
- (iii) a quotient map [4] provided a subset V of (Y, σ) is open if and only if $f^{-1}(V)$ is open in (X, τ) .

III. $G^*\alpha$ -QUOTIENT MAPS:

Definition 3.1: A surjective function $f: (X, \tau) \rightarrow (Y, \sigma)$ is said to be a $g^*\alpha$ -quotient map if f is $g^*\alpha$ -continuous and $f^{-1}(V)$ is open in (X, τ) implies V is a $g^*\alpha$ -open set in (Y, σ)

Example 3.2: Let $X = \{1, 2, 3, 4\}$ with $\tau = \{\emptyset, X, \{1\}, \{2\}, \{1, 2\}\}$, $Y = \{1, 2, 3\}$ with $\sigma = \{\emptyset, Y, \{1\}, \{2\}, \{1, 2\}\}$. Define a map $f: (X, \tau) \rightarrow (Y, \sigma)$ by $f(1) = 2, f(2) = 1, f(3) = 3 = f(4)$. $g^*\alpha-O(X) = \{\emptyset, X, \{1\},$

$\{2\}, \{3\}, \{4\}, \{1,2\}, \{1,3\}, \{1,4\}, \{2,3\}, \{2,4\}, \{1,2,3\}, \{1,2,4\}\}$. $g^*\alpha\text{-O}(Y) = \{\emptyset, Y, \{1\}, \{2\}, \{1,2\}\}$. Then f is $g^*\alpha$ -continuous and $f^{-1}(V)$ is open in (X, τ) implies V is $g^*\alpha$ -open set in (Y, σ) . Hence f is $g^*\alpha$ -quotient map.

Theorem 3.3: Every quotient map is $g^*\alpha$ -quotient.

Proof: Let $f: (X, \tau) \rightarrow (Y, \sigma)$ be a quotient map. Since every continuous map is $g^*\alpha$ -continuous and every open set is $g^*\alpha$ -open the proof follows from the definition.

But the converse need not be true.

Example 3.4: Let $X = \{1,2,3,4\}$ with $\tau = \{\emptyset, X, \{3\}, \{4\}, \{3,4\}\}$ $Y = \{1,2,3\}$. $\sigma = \{\emptyset, Y, \{1,3\}\}$. Define $f: (X, \tau) \rightarrow (Y, \sigma)$ by $f(1) = 2 = f(2)$, $f(2) = 3$, $f(3) = 1$, $f(4) = 3$. $g^*\alpha\text{-O}(X) = \{\emptyset, X, \{1\}, \{2\}, \{3\}, \{4\}, \{1,3\}, \{1,4\}, \{2,3\}, \{2,4\}, \{3,4\}, \{1,3,4\}, \{2,3,4\}\}$. $g^*\alpha\text{-O}(Y) = \{\emptyset, Y, \{1\}, \{3\}, \{1,3\}\}$. Here f is $g^*\alpha$ -quotient but not quotient map since $f^{-1}(\{3\}) = \{4\}$ which is open in X but the set $\{3\}$ is not open in Y .

Prop 3.5: If a map $f: (X, \tau) \rightarrow (Y, \sigma)$ is surjective, $g^*\alpha$ -continuous and $g^*\alpha$ -open then f is $g^*\alpha$ -quotient map.

Proof: we only need to prove $f^{-1}(V)$ is open in (X, τ) implies V is $g^*\alpha$ -open set in (Y, σ) . Let $f^{-1}(V)$ be open in (X, τ) . Then $f(f^{-1}(V))$ is $g^*\alpha$ -open in (Y, σ) since f is $g^*\alpha$ -open. Hence V is $g^*\alpha$ -open in (Y, σ) .

Definition 3.7: A surjective function $f: (X, \tau) \rightarrow (Y, \sigma)$ is said to be $g^*\alpha^*$ -quotient map if f is $g^*\alpha$ -irresolute and $f^{-1}(V)$ is $g^*\alpha$ -open in (X, τ) implies V is open in (Y, σ)

Example 3.8: Let $X = \{1,2,3,4\}$ with $\tau = \{\emptyset, X, \{1\}, \{3,4\}, \{1,3,4\}\}$ $Y = \{1,2,3\}$ with $\sigma = \{\emptyset, Y, \{1,2\}\}$. Define $f: (X, \tau) \rightarrow (Y, \sigma)$ by $f(1) = 1$, $f(2) = 3$, $f(3) = 2 = f(4)$. $g^*\alpha\text{-O}(X) = \{\emptyset, X, \{1\}, \{3\}, \{4\}, \{1,3\}, \{1,4\}, \{3,4\}, \{1,3,4\}\}$. $g^*\alpha\text{-O}(Y) = \{\emptyset, Y, \{1\}, \{2\}, \{1,2\}\}$. Here f is $g^*\alpha$ -irresolute and $f^{-1}(V)$ is $g^*\alpha$ -open in (X, τ) implies V is open in (Y, σ)

Theorem 3.9: Every $g^*\alpha^*$ -quotient map is $g^*\alpha$ -irresolute.

Proof proof is obviously true from the definition.

But the converse need not be true.

Example 3.10: Let $X = \{1,2,3,4\}$ with $\tau = \{\emptyset, X, \{1\}, \{1,2,4\}\}$. $Y = \{1,2,3\}$ with $\sigma = \{\emptyset, Y, \{2\}, \{2,3\}\}$ Define $f: (X, \tau) \rightarrow (Y, \sigma)$ by $f(1) = 2$, $f(3) = 1$, $f(2) = 3 = f(4)$. $g^*\alpha\text{-O}(X) = \{\emptyset, X, \{1\}, \{2\}, \{4\}, \{1,2\}, \{1,3\}, \{1,4\}, \{2,4\}, \{1,2,3\}, \{1,2,4\}, \{1,3,4\}\}$. $g^*\alpha\text{-O}(Y) = \{\emptyset, Y, \{2\}, \{3\}, \{1,2\}, \{2,3\}\}$. Here f is $g^*\alpha$ -irresolute but not $g^*\alpha^*$ -quotient map since $f^{-1}(\{1,2\}) = \{1,3\}$ is $g^*\alpha$ -open in (X, τ) but $\{1,2\}$ is not open in (Y, σ) .

4. Strong form of $g^*\alpha$ -quotient map:

Definition 4.1: Let $f: (X, \tau) \rightarrow (Y, \sigma)$ be a surjective map. Then f is called strongly $g^*\alpha$ -quotient if a set U is open in Y iff $f^{-1}(U)$ is a $g^*\alpha$ -open set in X .

Example 4.2 Let $X = \{1,2,3,4\}$ with $\tau = \{\emptyset, X, \{1\}, \{1,4\}, \{1,2,4\}\}$. $Y = \{1,2,3\}$ with $\sigma = \{\emptyset, Y, \{1\}, \{1,2\}, \{1,3\}\}$ Define $f: (X, \tau) \rightarrow (Y, \sigma)$ by $f(1) = 1$, $f(2) = 2$, $f(3) = 3 = f(4)$. $g^*\alpha\text{-O}(X) = \{\emptyset, X, \{1\}, \{2\}, \{4\}, \{1,2\}, \{1,3\}, \{1,4\}, \{2,4\}, \{1,2,3\}, \{1,2,4\}, \{1,3,4\}\}$. $g^*\alpha\text{-O}(Y) = \{\emptyset, Y, \{1\}, \{1,2\}, \{1,3\}\}$. The map f is a strongly $g^*\alpha$ -quotient map.

Theorem 4.3 Every strongly $g^*\alpha$ -quotient map is $g^*\alpha$ -open map.

Proof: Let $f: (X, \tau) \rightarrow (Y, \sigma)$ be a strongly $g^*\alpha$ -quotient map. Let V be any open set in (X, τ) . Since every open set is $g^*\alpha$ -open, V is $g^*\alpha$ -open in (X, τ) . Then $f^{-1}(f(V))$ is $g^*\alpha$ -open in (X, τ) . Since f is strongly $g^*\alpha$ -quotient, then $f(V)$ is open in (Y, σ) and hence $f(V)$ is $g^*\alpha$ -open in (Y, σ) . This shows that f is a $g^*\alpha$ -open map.

Here the reverse implication is not true.

Example 4.4: Let $X = \{1,2,3,4\}$ with $\tau = \{\emptyset, X, \{1\}, \{2,3\}, \{1,2,3\}\}$. $Y = \{1,2,3\}$ with $\sigma = \{\emptyset, Y, \{1,2\}, \{3\}\}$. Define $f: (X, \tau) \rightarrow (Y, \sigma)$ by $f(1) = 1 = f(2)$, $f(3) = 3$, $f(4) = 2$. $g^*\alpha\text{-O}(X) = \{\emptyset, X, \{1\}, \{2\}, \{3\}, \{1,2\}, \{1,3\}, \{2,3\}, \{1,2,3\}\}$. $g^*\alpha\text{-O}(Y) = \{\emptyset, Y, \{1\}, \{2\}, \{3\}, \{1,2\}, \{1,3\}, \{2,3\}\}$. Here f is a $g^*\alpha$ -open map but not a strongly $g^*\alpha$ -quotient map since the set $\{1,2\}$ is open in (Y, σ) but $f^{-1}(\{1,2\}) = \{1,2,4\}$ is not $g^*\alpha$ -open in (X, τ)

Theorem 4.5: Every strongly $g^*\alpha$ -quotient map is $g^*\alpha$ -quotient

Proof: Let V be any open set in (Y, σ) . Since f is strongly $g^*\alpha$ -quotient, $f^{-1}(V)$ is a $g^*\alpha$ -open set in (X, τ) . Hence f is $g^*\alpha$ -continuous. Let $f^{-1}(V)$ be open in (X, τ) . Then $f^{-1}(V)$ is $g^*\alpha$ -open in (X, τ) . Since f is strongly $g^*\alpha$ -quotient, V is open in (Y, σ) . Hence f is $g^*\alpha$ -quotient.

Converse need not be true here

Example 4.6: Let $X = \{1,2,3,4\}$ with $\tau = \{\emptyset, X, \{2\}, \{3,4\}, \{2,3,4\}\}$. $Y = \{1,2,3\}$ with $\sigma = \{\emptyset, Y, \{2,3\}\}$ Define $f: (X, \tau) \rightarrow (Y, \sigma)$ by $f(1) = 1$, $f(2) = 2$, $f(3) = 3 = f(4)$. $g^*\alpha\text{-O}(X) = \{\emptyset, X, \{2\}, \{3\}, \{4\}, \{2,3\}, \{2,4\},$

$\{3,4\}, \{2,3,4\}\}$. $g^*\alpha\text{-O}(Y) = \{\emptyset, Y, \{2\}, \{3\}, \{2,3\}\}$. Here f is a $g^*\alpha$ -quotient but not a strongly $g^*\alpha$ -quotient map since the set $f^{-1}(\{2\}) = \{2\}$ is $g^*\alpha$ -open in (X, τ) but $\{2\}$ is not open in (Y, σ) .

Theorem 4.7: Every $g^*\alpha^*$ -quotient map is strongly $g^*\alpha$ -quotient

Proof: Let $f: (X, \tau) \rightarrow (Y, \sigma)$ be $g^*\alpha^*$ -quotient map. Let U be an open set in Y . Then U is $g^*\alpha$ -open in Y . Since f is $g^*\alpha$ -irresolute, $f^{-1}(U)$ is $g^*\alpha$ -open in X . If $f^{-1}(U)$ is $g^*\alpha$ -open in X , then f is $g^*\alpha^*$ -quotient map implies that U is open set in Y . Hence f is strongly $g^*\alpha$ -quotient.

corollary 4.8: Every $g^*\alpha^*$ -quotient map is $g^*\alpha$ -quotient.

Proof: By theorem 4.7, Every $g^*\alpha^*$ -quotient map is strongly $g^*\alpha$ -quotient and by theorem 4.5 every strongly $g^*\alpha$ -quotient map is $g^*\alpha$ -quotient, every $g^*\alpha^*$ -quotient map is $g^*\alpha$ -quotient.

Definition 4.9: Let $f: (X, \tau) \rightarrow (Y, \sigma)$ be a surjective map. Then f is called strongly $g^*\alpha^*$ -quotient if a set U is $g^*\alpha$ -open in Y iff $f^{-1}(U)$ is $g^*\alpha$ -open in X .

Example 4.10: : Let $X = \{1,2,3,4\}$ with $\tau = \{\emptyset, X, \{1\}, \{1,2,4\}\}$. $Y = \{1,2,3\}$ with $\sigma = \{\emptyset, Y, \{2\}\}$. Define $f: (X, \tau) \rightarrow (Y, \sigma)$ by $f(1) = 2 = f(3), f(2) = 1, f(4) = 3$. $g^*\alpha\text{-O}(X) = \{\emptyset, X, \{1\}, \{2\}, \{4\}, \{1,2\}, \{1,3\}, \{1,4\}, \{2,4\}, \{1,2,3\}, \{1,2,4\}, \{1,3,4\}\}$. $g^*\alpha\text{-O}(X) = \{\emptyset, X, \{1\}, \{2\}, \{4\}, \{1,2\}, \{1,3\}, \{1,4\}, \{2,4\}, \{1,2,3\}, \{1,2,4\}, \{1,3,4\}\}$. $g^*\alpha\text{-O}(Y) = \{\emptyset, Y, \{1\}, \{2\}, \{3\}, \{1,2\}, \{2,3\}\}$. Here f is strongly $g^*\alpha^*$ -quotient.

Theorem 4.11: Every $g^*\alpha^*$ -quotient map is strongly $g^*\alpha^*$ -quotient

Proof: Let $f: (X, \tau) \rightarrow (Y, \sigma)$ be $g^*\alpha^*$ -quotient map. Let U be a $g^*\alpha$ -open set in Y . Since f is $g^*\alpha$ -irresolute, $f^{-1}(U)$ is $g^*\alpha$ -open. Let $f^{-1}(U)$ be $g^*\alpha$ -open in X . since f is $g^*\alpha^*$ -quotient, it follows that U is open. Hence U is $g^*\alpha$ -open and hence f is a strongly $g^*\alpha^*$ -quotient map.

Theorem 4.12: Every strongly $g^*\alpha^*$ -quotient map is $g^*\alpha$ -quotient

Proof: Let $f: (X, \tau) \rightarrow (Y, \sigma)$ be strongly $g^*\alpha^*$ -quotient map. Let V be an open set in Y . Then V is a $g^*\alpha$ -open set. Since f is strongly $g^*\alpha^*$ -quotient, $f^{-1}(V)$ is $g^*\alpha$ -open. Hence f is $g^*\alpha$ -continuous. Let $f^{-1}(V)$ be an open set in X . Then $f^{-1}(V)$ is $g^*\alpha$ -open in X . Hence V is $g^*\alpha$ -open and f is $g^*\alpha$ -quotient map.

Theorem 4.13: Let $f: (X, \tau) \rightarrow (Y, \sigma)$ be a strongly $g^*\alpha^*$ -quotient map and Y is a ${}_{\alpha}T_{1/2}^{**}$ -space then f is a strongly $g^*\alpha$ -quotient map.

Proof: Let U be an open set in Y . Then U is $g^*\alpha$ -open set in Y . Since f is strongly $g^*\alpha^*$ -quotient, $f^{-1}(U)$ is $g^*\alpha$ -open in X . Let $f^{-1}(U)$ be $g^*\alpha$ -open in X . Then U is $g^*\alpha$ -open in Y . Since Y is a ${}_{\alpha}T_{1/2}^{**}$ -space U is open in Y . Hence f is strongly $g^*\alpha$ -quotient map.

From the above results we have the following diagram where $A \rightarrow B$ represents A implies B but not conversely.
